My Portfolio: Code Reference

Erin Zabërgja · Introduction to Web Technologies · 5 pages (index, skills, projects, education, contact) + css/style.css

1. HTML: what I used and why

Element / attribute	What it does	Where / why I used it
`<!DOCTYPE html>`	Tells the browser this is HTML5	First line of every page
`<html lang="en">`	Sets the page language	Helps screen readers and search engines
`<meta charset="UTF-8">`	Letters like ë show correctly	My name has ë
`<meta name="viewport">`	Scales the page to the phone width	Every page head
`<title>`	Text on the browser tab	Different on each page ("Erin Zabërgja | Skills")
`<link rel="stylesheet">`	Connects the CSS file	One stylesheet for all 5 pages
`<header>`	Top part: logo, tagline, navigation	Same on all pages
`<h1> with logo <img> inside a link`	Main title of the page; logo links home	One h1 per page; the logo's alt text is my name
`<nav aria-label="Main">`	Navigation area, named for screen readers	Contains the of 5 links
`<ul> / <li>`	Unordered list	Navigation, Interests, Languages, Certificates, Contact
`href="skills.html"`	Relative link to another page	Navigation (no full address, works on any computer)
`aria-current="page"`	Tells screen readers which page I am on	On the current page's nav link
`class="current-page"`	A name for CSS styling	Gives the white pill; same name on all pages
`<main>`	The main content of the page	One per page
`<section id="about">`	A themed part of the page	About, Interests, Skills, Projects, Education, Contact
`<article>`	Content that stands on its own	Each project card
`<h2> / <h3>`	Headings, in order	h2 = section, h3 = part inside (Languages, Certificates, project names)
`<img src alt width height>`	Shows an image	alt = text for people who can't see it; width/height stop the page from jumping
`loading="lazy"`	Loads the image when I scroll near it	Dental funnel screenshot
`<figure> / <figcaption>`	An image with its caption	Project screenshots
`<dl> / <dt> / <dd>`	Description list: term + explanation	Skills (skill + my real example)
`<table>, <caption>, <thead>, <tbody>, <tr>, <th scope="col">, <td>`	Data in rows and columns; scope says a th is a column heading	Education (4 pieces of info per row)
`#id link: href="#dentris"`	Jumps to the element with that id	Projects page jump links
`target="_blank" rel="noopener noreferrer"`	Opens in a new tab, safely	External links (Dentris, funnel, LinkedIn, GitHub)
`href="mailto:..."`	Opens the email program	Contact

`<sup>`	Superscript text	1st-year
`©  &`	HTML entities for © and &	Footer, certificate links
`<footer>`	Bottom part of the page	Copyright line, same on all pages

2. CSS: what I used and why

Selector / property	What it does	Where / why I used it
`:root { --color-dark: ... }`	Custom properties (variables)	8 colours; change once, updates everywhere
`var(--color-accent)`	Uses a variable's value	Links, headings, table header
`body`	Base style for the page	Arial, 16px, line-height 1.5, margin 0
`h2, h3`	Group selector: same style for both	Accent-coloured headings
`img { max-width: 100%; height: auto; }`	Images shrink to fit, keep proportions	All images
`background-image: linear-gradient(135deg, a, b)`	Blends two colours diagonally	Header
`text-align: center`	Centres text and inline things	Header, footer
`letter-spacing`	Space between letters	Tagline
`font-size: 1.1rem`	rem = relative to the base size (16px)	Tagline, captions (no space between 1.1 and rem)
`header img { display: block; margin: 0 auto; }`	Descendant selector; centres the logo	Block makes it a box; auto side margins centre it
`nav ul { list-style-type: none; padding: 0; }`	Removes bullets and indent	Navigation
`nav li { display: inline; }`	Items sit side by side	Navigation
`nav a { display: inline-block; padding; border-radius }`	Link is a rounded button	Inline-block lets padding work
`nav a:hover`	Pseudo-class: style when the mouse is over	Accent background
`.current-page, .current-page:hover`	Class selector; white pill + dark text	:hover rule has higher specificity than nav a:hover, so the pill does not change
`main { max-width: 800px; margin: 0 auto; }`	Centred column, not wider than 800px	All page content
`section { border; padding; margin-bottom }`	White box with a thin line	All sections
`margin: 0 auto 10px auto`	Shorthand: top, right, bottom, left	Profile photo
`border-radius: 50%`	Rounds corners; 50% = circle	Profile photo
`figure { margin: 0 }`	Removes the browser's default side margins	Project figures
`figcaption { color: muted; font-size: 0.9rem }`	Smaller grey caption	Under screenshots

`dt { font-weight: bold } / dd { margin }`	Bold skill name; removes default indent	Skills
`table { border-collapse: collapse }`	Merges borders into one line	Education
`td, th { border; padding; text-align }`	Cell borders, inner space, left aligned	Education
`th { background-color; color }`	Blue header row, white text	Education
`caption { font-weight: bold }`	Bold table title	Education
`footer { background-color; color; padding }`	Dark bar with white text	Bottom of every page
`/* comments */`	Notes for people, ignored by the browser	10 sections in page order

3. Quick answers if I am asked

Why 5 pages? The professor said in class that separate pages can earn extra points. I link them with relative links (Weeks 3 and 4).
Why one h1 with the logo? One main title per page; the logo's alt text is my name.
section vs article? A section is a themed part of the page; an article stands on its own (each project).
dl vs ul? A dl pairs a term with an explanation; a ul only lists items.
Why a table for education? Each entry has four pieces of information, so each gets a column.
aria-current vs current-page? aria-current is for screen readers; the class is for the look.
Tagline bug? No colour rule, so dark text on a dark header (contrast about 1.1 : 1). Fixed with a light-colour rule.
Specificity? The more specific selector wins: id, then class/pseudo-class, then element. That is why .current-page:hover beats nav a:hover.
Who made the logo? Claude created it and I chose it. It is declared in my AI-use statement.

This is my study reference. I wrote all HTML and CSS myself; Claude explained concepts and found bugs, as declared in my AI-use statement.
