Explanation

Erin Zabërgja

Purpose and audience

My page is for a business development internship recruiter. I want the reader to contact me about an internship by email or LinkedIn. After ten seconds, they should know what I am looking for: a business development internship. They should also know that I study AI in Business and run my own startup, Dentris.

Structure

I used the semantic elements section, article, and figure to organise my pages. For Education, I chose a table instead of a list. I chose it because each entry has four pieces of information, and a table puts each piece in its column, so the reader can find the information quickly.

Styling

My CSS file has 10 commented sections, in the same order as the page. I used Arial because it looks professional on every computer. I chose navy and blue because they look professional for a business reader. I used custom properties, such as --color-dark, so I can update every rule that uses the colour at once.

Problems and improvements

My tagline was black text on the dark header, so I could not read it. The reason was that I had no CSS rule for header p, so it used the page's dark text colour. I added a rule that sets its colour to the light variable. I wrote the rules for figure and .project-screenshot inside the .project-card rule. This is called nesting, and it was not taught in the course, so I moved them to separate rules. Next, I would use Flexbox to put the photo and the text side by side.

Reflection

I built a five-page portfolio and learned how semantic HTML and organised CSS work together. All five pages show 0 errors in the W3C validator.

AI-use statement

I used Claude (made by Anthropic) during this project. I asked it to explain concepts and errors, find bugs in my own code, and check the grammar of this text. Claude also created the logo image and the sentence starters and options for this explanation. I typed all the HTML and CSS myself and chose which options to use for the explanation. Claude also drafted the README and description of my GitHub repository, which are not part of the submitted files.
